

The day is set down on which Mr. Rumker compared the Comet with the above stars, and to this date the *apparent* places are to be referred.

*BROSEN'S Second Comet.*

*ELEMENTS.*

By M. d'Arrest, from the Königsberg observation of May 1, and the Berlin observations of May 4 and 9.

Time of Perihelion Passage, 1846, June 5<sup>h</sup> 27<sup>m</sup> 69<sup>s</sup>6, Berlin Mean Time.

Perihelion .....	162° 36' 52".6	} Mean Equinox, 1846.
Node .....	262 2 52.6	
Inclination .....	29 15 15".0	
Log. <i>q</i> .....	9.8033725	

Retrograde.

By M. Petersen, *approximate*, from the Königsberg observation of May 1, and the Altona observations of May 2 and 3.

Time of Perihelion Passage, 1846, June 5<sup>h</sup> 28<sup>m</sup> 78<sup>s</sup>9, Berlin Mean Time.

Perihelion .....	162° 34' 2"	} Apparent Equinox, May 2.
Node .....	261 59 49	
Inclination .....	29 18 30	
Log. <i>q</i> .....	9.803094	

Retrograde.

There is some likeness with the comets of 1701, 1766, and in some respects with the comets of 1790, 1798.

According to these elements, the comet will pass its descending node July 19, and on July 18 will approach the earth very nearly, *i. e.* within about  $\frac{1}{20}$  of the earth's distance from the sun; at this time, however, the earth will be in the diametrically opposite point of her orbit.

By M. Rumker, *approximate* :—

Perihelion Passage, 1846, June 5<sup>h</sup> 22<sup>m</sup> 49<sup>s</sup>07, Greenwich Mean Time.

Perihelion .....	162° 42' 57"
Node .....	262 12 40
Inclination .....	29 6 59.7
Log. <i>q</i> .....	9.8037417

Motion retrograde.

By W. W. Boreham, Esq. *approximate*.

Perihelion Passage, June 5<sup>h</sup> 24<sup>m</sup> 84, Greenwich Mean Time.

Perihelion .....	162° 37' 13".7	} Mean Equinox, May 1.
Node .....	262 11 21.4	
Inclination .....	29 13 35	
Log. <i>q</i> .....	9.8031918	

Motion retrograde.

The data employed by Mr. Boreham are :—

Greenwich M.T.	Comet's		Sun's	
	Longitude.	Latitude.	Longitude.	Log. Rad. Vector.
1846. May 1 <sup>h</sup> 49 <sup>m</sup> 29 <sup>s</sup>	354° 55' 3" 0	+ 39° 16' 48"	41° 11' 1" 0	0.0036208
10 <sup>h</sup> 55 <sup>m</sup> 99 <sup>s</sup> 3	67 31 41.3	48 46 5.25	49 57 2.6	0.0045194
15 <sup>h</sup> 51 <sup>m</sup> 28 <sup>s</sup> 7	89 4 48.2	+ 35 39 54.3	54 43 27.6	0.0049834

reckoned from mean equinox of May 1.

By J. R. Hind, Esq. :—

Perihelion Passage, 1846, June 5<sup>h</sup> 24<sup>m</sup> 70<sup>s</sup> 1, Greenwich Mean Time.

Perihelion ..... 162° 33' 51" 1 } Mean Equinox,  
Node ..... 261 57 45.5 } May 0, 1846.  
Inclination ..... 29 19 48  
Log. *q* ..... 9.8031613

Motion retrograde.

These elements are computed by Olbers' method, taking into account the complete expression for the ratio of the curtate distances, on the Königsberg observation of May 1, and the Berlin observations of May 7 and 13.

The data for the calculation, referred to the mean equinox of May 0, 1846, are :—

Greenwich M. T.	Comet's		Sun's	
	Longitude.	Latitude.	Longitude.	Log. Rad. Vector.
1846. May 1 <sup>h</sup> 49 <sup>m</sup> 29 <sup>s</sup>	334° 54' 52"	+ 39° 16' 46"	41° 10' 52"	0.0036208
7 <sup>h</sup> 36 <sup>m</sup> 95 <sup>s</sup> 9	34 26 33	55 14 53	46 52 5	0.0042120
13 <sup>h</sup> 46 <sup>m</sup> 92 <sup>s</sup> 1	82 55 25	+ 40 32 31	52 45 11	0.0047950

The error of the middle observation is —0".2 in longitude, —4".6 in latitude.

ELLIPTIC *Elements of BRORSEN's Second Comet.*

By M. Wichmann of Königsberg from the measurements with the heliometer, reckoned from the mean equinox 1846.0.

Time of Perihelion Passage, 1846, June 5<sup>h</sup> 55<sup>m</sup> 53<sup>s</sup> 0, Berlin M.T.

Log. *a* 1.7357679  
Log. *e* 9.9949154 (  $\varphi = 81^{\circ} 14' 58.8''$   
Log. *q* 9.8017037  
 $\Omega$  ..... 261 51 14.1  
Perih. —  $\Omega$  ..... 99 50.19.6  
*i* ..... 150 41 13.0
